

Extract Keywords

Description

Extracts a table containing one row per **unique keyword** found in the database, where a keyword is unique by the keyword itself and the type of keyword it is (author or ISI). The resulting table contains the following columns:

- *keyword*. The keyword.
- *type*. The type of the keyword. Keywords are either provided by the authors of the papers, or generated by ISI automatically. See [Load ISI File Into Database/KEYWORD](#) for more details.
- *occurrences_in_dataset*. The number of times this **unique keyword** occurs in the dataset. Keywords from authors are counted separately from keywords generated by ISI.

Implementation Details

The specific query run by the tool can be found in the [source code](#).
